Sit back and listen to this song that I'm singin',  
Photon, Proton, Synchroton are interesting  
Science is better than love can ever be  
Falling in love is based on chaotic theory!

Emotions are exhausting,  
Quantum mechanics never ever make you frown  
With scientific methods,  
Imaginary walls will come tumbling down, yeah!

Rap-  
Listen, through his experiments, Heisenberg  
concluded that the accurate measurements of  
one of two related observable quantities, such  
as position and momentum, produces  
uncertainties in the measurements of the  
other. He figured that the product of the  
uncertainties of position and the uncertainties  
of momentum are equal to or greater than  $\frac{h}{2\pi}$ , where  $h$  equals Plank's constant. It  
means that observations in quantum mechanics  
always lead to uncertainty. You understand  
this, don't you?

Ryoko: No. Not at all.  
Kiyone: I think it's hopeless.
