

## The County Medical Examiners "Medicocriminal Entomology"

Visit "[Medicocriminal Entomology](#)" on [MotoLyrics.com](http://MotoLyrics.com)

When unidentified remains are relinquished to our  
care  
That are so decayed and liquefied as to make  
diagnosis  
quite a chore  
When the putrescent canvas of death is teeming with  
bristling life  
With tiny anthropoid stowaways nestled in every pore...  
My autopsy technicians mistake the corpse shudder for  
a cadaveric spasm  
But upon closer inspection they witness the nauseating  
wave of insect activity  
The feasting and chatter drowns the neon hum from  
the  
morgue lamps and fans  
And the ambient temperature rises 5 degrees as their  
chitinous bodies skitter in putridity...  
The corpse is alive...reanimated through entomological  
means  
The John Doe swells...as parasitic activity literally  
bursts through his seams  
Seeping rivers of eggs...hatching larvae are hurriedly  
washed down the drain  
Call the Forensic Entomologist...everyone knows he's  
got  
bugs on the brain...  
...Carcass hive...  
...Cadaverine nest...  
The Forensic Entomologist is a specialist in this  
field  
Of which there are three separate and distinct  
components  
The Urban field deals with insect/human environment  
matters  
Stored-Products handles infestation of commodities  
and  
products...  
But the one that we require is the Medicolegal  
Entomology field  
With its eccentric bug experts and their forensic  
Ph.D.'s  
They've classified and catalogued their necrophilous

winged friends

And can determine PMI by the stadiums and stages of insect activity...

...Blowflies...spiders...beetles...mites and lice...

...Maggots...larvae...pupa...hatch and fly...

...Crawling...squirming...breeding...burrowing...

...Medicocriminal entomology...

The Forensic Entomologist will analyze the cadaveric colonization

Taking samples and noting the current state of the Blowfly population

After determining the extent of the recent Coleoptera infestation

He will estimate the time of death so that we may continue with the examination...

...When tissue liquefies and attracts the clavicorn ...

...The flies are drawn and oviposit their eggs...

...From this predictable process, tiny maggots are born...

...Named Instar Larvae, which then grow to Prepupae...

The maggot molts through three instar stages, plumping

as they gnaw

Colonies hatch together and migrate across the corpse as a collective group

As a result of this infestation, they disseminate bacteria and secrete enzymes

Which enable nearly all of the soft tissue to be dissolved and consumed...

Depending on the habitat and the abundance of the region

The expert can determine if the Diptera is currently in season

Whether the Bottle fly prefers bright sunlight or shade

And if the Coleopteran is nocturnal or active during the day...

Oviposited eggs encrust the natural orifices and moist recesses

Maggots swim in wound sites consuming rotting necrotic

flesh

The examiner's gloved hand is thrust wrist-deep in this bug colony

Searching through the thriving mush for additional squirming evidence...

...Parasitic swarm...

...Maggot colony...

...Blowflies...spiders...beetles...mites and lice...

...Maggots...larvae...pupa...hatch and fly...

...Crawling...squirming...breeding...burrowing...

...Medicocriminal entomology...
